Investigating the impact of lipid-protein interactions in membrane protein structure and conformational dynamics

Award Amount: \$729,803 (total)

The proposal aims to identify unifying principles that determine lipid-protein interactions that stabilize fold and facilitate conformational change. Using several biophysical methods, a model system, TM0026,

and a signal peptidase II, LspA, the molecular origins that stabilize membrane protein folds and facilitate functional conformational dynamics will be determined. The results of this proposal will provide an understanding of the lipid-protein interactions that dictate fold and function of membrane proteins.
